**NEW QUESTION 2**
Which two modeling approaches could be used to handle exceptions thrown by a service? (Choose two.)

A. subprocess
B. event subprocess
C. error and event
D. error catch event as a boundary event on the service task

**Answer:** BD

**Explanation:** You can handle the exceptions that occur in an activity using the following: *A boundary error catch event *An event subprocessBoundary error catch events enable you to resume the main process flow after handling theexception.If you want to reuse the exception handling flow for multiple tasks in your process, then eventsubprocesses are more efficient than boundary catch events. Event subprocesses enable you todefine a cleaner process with less effort because the catch error event is located within the eventsubprocess. To reuse an exception handling flow using boundary catch events, you must define aboundary catch event for each of the tasks, and then connect those boundary events to theexception handling flow.

**NEW QUESTION 7**
The initial performer of a task is determined by the role associated with the swim lane in which the task is modeled except when you use a(n) _____.

A. complex task
B. user task
C. FYI task
D. group task

**Answer:** A

**Explanation:** A complex user task uses a complex routing flow that is defined within the humantask.BPM Studio offers a number of human task patterns out of the box, to make it easy to implementthe most common types of human tasks. For example, the Simple pattern just assigns individualusers or groups. The Management pattern is used for a sequential list of approvers up themanagement chain. Initiator is for the person who kicks off the process.For most of these,swimlane roles are used to determine assignments. For the Complex task, however, the swimlaneis irrelevant, and routing and assignments are typically more complicated.Note: Swimlanes are the horizontal lines that run across the process editor. All flow objects mustbe placed within a swimlane.Swimlanes can also be used to group flow objects based on the roles defined within your process.Swimlanes that contain user tasks must have roles assigned to them. Swimlanes visually displaythe role responsible for performing each flow object within your process. Additionally, you canhave multiple swimlanes that are assigned to the same role.Swimlanes can make your process more readable when you must use the same role in differentparts of the same process.
